PATIENT ADMISSION STATUS

PRESENTATION

- An abscess is a localized collection of pus surrounded by inflammatory tissue. It can occur in any part of the body, but most commonly in the skin.
- Risk factors for developing an abscess include poor personal hygiene, injection drug use, and a weakened immune system, such as in people with diabetes or those taking immunosuppressive medications.
- Common symptoms include pain, redness, swelling, and the presence of a visible lump or boil. The affected area may also feel warm to the touch and may be accompanied by fever and chills in more severe cases.
- Diagnosis is typically made by a physical examination, and treatment may involve draining the abscess and prescribing antibiotics to clear the infection.

Diagnosis: Cellulitis of other parts of trunk, unspecified, initial encounter, subsequent encounter, sequelae

Acute pain in right lower quadrant of abdomen, initial encounter, subsequent encounter, sequelae

Abscess of other parts of trunk, initial encounter, subsequent encounter, sequelae
