

[illegible]

Dear (10)(2e)

Thank you for sharing the document!

We agree with the conclusions, and have a couple of minor comments below for your consideration.

The risk of reinfection is not necessarily tied to waning antibody titers as reinfection of other corona viruses has been shown to likely occur in the presence of relative high and stable antibody titers. (Edridge, A.W.D., Kaczorowska, J., Hoste, A.C.R. et al. Seasonal coronavirus protective immunity is short-lasting. *Nat Med* (2020). <https://doi.org/10.1038/s41591-020-1083-1>)

Under: **“Factors to consider in assessing the evidence for a second SARS-CoV-2 infection”:**

A rise in antibody titers (IgG) in convalescent sera taken after the second episode compared to the first makes reinfection more likely and could be used retrospectively in assessment of possible reinfections.

Best wishes.
