

* Primary health care centres, emergency rooms, specific points of diagnostic.

** Persons with severe infection, health care workers and hospitalized people initiating symptoms.

*** It is preferable to perform RDT within long-term care facilities (workers and residents) unless RT-PCR result is available in <24h. In such case, RT-PCR is of preference.

**** If initiation of symptoms was several days before, a high-efficiency serological determination of Ig G ~~total~~ be used to diagnosis.

‡ If there is not availability of RDT, then a RT-PCR should be performed

* RT-PCR can also be performed considering availability or operational issues.
