

Simulatie koren

- Model: AirCov2 v1.2
- Auteur: (10)(2e), RIVM
- Datum: 28-10-2020

Aannames model

- Direct gelijkelijke verdeling van de virusdeeltjes in aerosolen over de ruimte.
- Intacte fractie (kweekbare virussen) = 0.018 (vrij hoog)
- Infectieuze fractie (dosisrespons) = 0.054 (de meeste infectieuze van coronavirussen, waarvan dit bekend is)
- Eén uitscheider: 10^8 virusdeeltjes per ml mucus (8,5% kans)

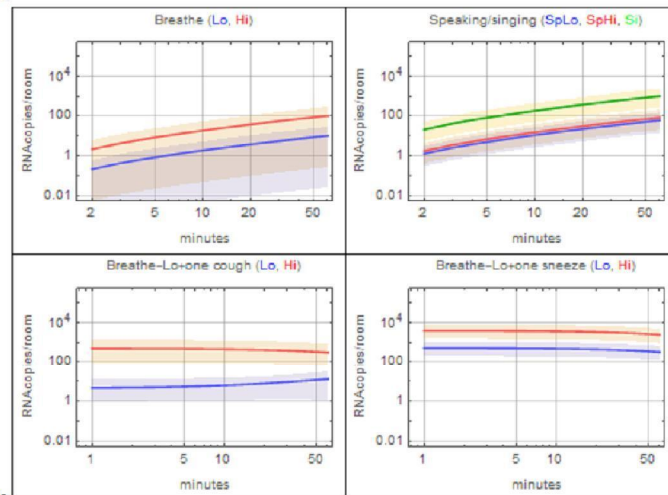

Scenario's

- Heerde: 14x14x2.6 m³; 14 personen; 1uur
- Alkmaar: 11x8x6 m³; 16 personen; 1uur
- Geen ventilatie; verversing 1 keer per uur; 20 keer per uur

Resultaten

- Groene grafiek is zingen; grafieken tonen continue toename door uitademen, spreken, zingen; eenmalige inbreng door een hoest en nies; afname door inademen, virusinactivatie en ventilatie.
- Beide ruimtes zijn ongeveer gelijk qua volume.
- Ongeveer 10% kans op blootstelling indien geen ventilatie; bijbehorende kans op infectie/ziekte ongeveer 0,5%.
- Nauwelijks kleinere kansen op blootstelling, infectie/ziekte indien de lucht in de ruimtes per uur geheel wordt ververst.
- Kansen zijn één orde in grootte kleiner bij 20 keer per uur de lucht geheel ververset.

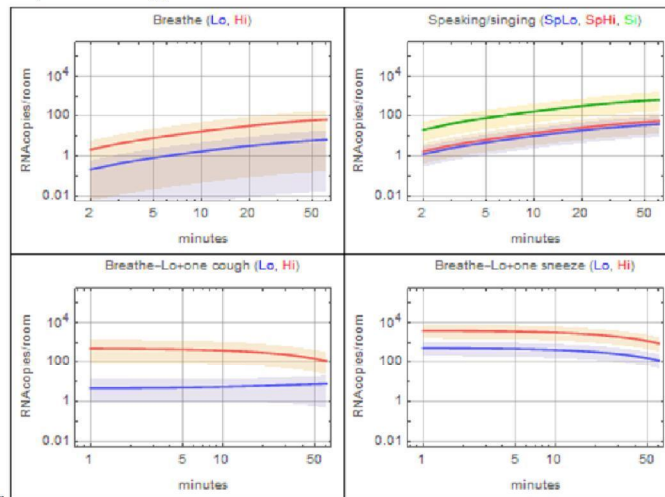

Heerde; geen

ventilatie
